## Stink Bug/Ladybug/Cluster Fly Control

- Stink bugs, ladybugs, and cluster flies are insects that live outdoors in the warmer months and seek out the warmth and shelter of our homes in the fall to overwinter.
- **Preventive spray application** in the fall is the best way to prevent these insects from getting in to your house and overwintering.
- Homeowners can also seal areas where stink bugs, ladybugs, and cluster flies could be getting inside such as cracks around windows and doors, attic vents, and chimneys.
- Control methods cannot completely prevent these insects from finding their way into your home, but annual maintenance will greatly reduce the number of insects that get inside, overwinter, and emerge again in the spring.

Insects - Rodents - Wildlife
